CompactDry “Nissui” TC Illustration Manual
Weigh 50g solid sample and add 450mL Butterfield’s buffered phosphate diluent to the sample.

It is recommended to use a stomacher bag with filter to eliminate risks of carry over of tiny pieces of foodstuffs into the surface of the medium.

Homogenize this mixed sample by a blender.
Open aluminum bag, and take out a set of 4 plates.
Take off the cap of the plate

Write the appropriate information on the memorandum section.
Pipette 1ml of homogenized specimen (to be further diluted if necessary) in the middle of dry sheet of Compact Dry TC.

Specimen diffuses automatically and evenly into all over the sheet (total medium of 20 cm²) to transform it into gel within seconds.
Viable count in swab test sample

Inoculate 1 ml of wiping solution (to be diluted if necessary), which is obtained from cotton swab,
Turn over the plate capped put in an incubator. Incubate 48 hours for TC at 35 °C.
From backside of the plate, count the number of colored colonies appeared in the medium. White paper placed under the plate can help to count colonies easier.

Colonies grown on Compact Dry TC are almost all red colored.

Detection limit of Compact Dry TC is between 1 – 300 cfu/plate.
